IoT Use Case :
Internet of Vehicles (IoV)

Other Case Studies :
https://iot.eclipse.org/community/resources/case-studies/

- Internet of Vehicles (IoV) is integration of IT in vehicles, enabling communication between vehicles, infrastructure, and the cloud. It will facilitate :
    - exchange of data between vehicles, traffic management systems, and the cloud, allowing for real-time traffic updates,
    - predictive analytics, and personalized services.
    - enable autonomous driving and fleet management, improving the overall driving experience for Volkswagen customers.

  Communication between the Telematics-Box (T-Box) and the vehicle's machine system is one of prime importance in IoV.

- High concurrency and low latency is achieved using MQTT protocol. This system is expected to support the seamless communication between vehicles and encompassing infrastructure.

- EMQ Technologies, a leader in Open Source MQTT Broker implementation is facilitating Volkswagen to in its development of the IoV system that enables highly performant and secure communication using MQTT 3.1.1

IoT Use Case :
FleetLINK : Fleet Management System

www.RKSTech.in

- Fleet Link System is a wireless transportation management solution
  - optimize fleet operations, including real-time GPS tracking, automated reporting, and alerts for potential issues.
  - System is designed for fleets, allowing them to streamline their operations, reduce costs, and increase driver productivity.
  - Also provides data insights to help fleets make informed decisions as Transporters can stay connected and in control of their operations from virtually anywhere.

- Key Feature
  - Real time remote monitoring and history
  - Full two-way control turns units
  - Geofence programmable remote locking security ensures trailer doors remain locked beyond controlled areas.
  - Analytics applied to operational data and shared through entire organization.

- Connectivity Protocols – Cellular, MQTT, Wi-Fi

- Data Collected – Fuel Consumption, Per-Unit Maintenance Costs, Status, Vehicle Location Tracking, Labor Costs
